TECHNICAL PAPER NO. 349

**Alaska Migratory Bird Subsistence Harvest Estimates,
2004–2007,
Alaska Migratory Bird Co-Management Council**

Liliana C. Naves
Alaska Department of Fish and Game
Division of Subsistence, Anchorage

Alaska Department of Fish and Game
Division of Subsistence
333 Raspberry Road, Anchorage, Alaska 99518-1599

Revised Edition, March 2010

Development and publication of this manuscript were financed by U.S. Fish and Wildlife Service under Cooperative Agreement 70181-7-J653.

Cover Herman Squartsoff collects glaucous-winged gull eggs, Kodiak. Photograph by Donna Dewhurst, used with permission.

The Division of Subsistence Technical Paper series was established in 1979 and represents the most complete collection of information about customary and traditional uses of fish and wildlife resources in Alaska. The papers cover all regions of the state. Some papers were written in response to specific fish and game management issues. Others provide detailed, basic information on the subsistence uses of particular communities which pertain to a large number of scientific and policy questions.

Technical Paper series reports are available through the Alaska State Library and on the Internet: <http://www.subsistence.adfg.state.ak.us/>. This publication has undergone editorial and professional review.

ERRATA

Originally published in December 2009, Technical Paper No. 349, *Alaska Migratory Bird Subsistence Harvest Estimates, 2004–2007*, Alaska Migratory Bird Co-Management Council, has been revised and updated to reflect the following changes:

- Table 146 (North Slope Region, 2007, p. 170) has been updated to include a footnote regarding the harvest of yellow-billed loons.
- The tables listed below have been revised to correct harvest estimates at the regional level for the Yukon-Kuskokwim Delta region.

ABSTRACT

This report presents subsistence harvest estimates of migratory birds and their eggs in Alaska for the data years 2004–2007. Data were gathered through the harvest assessment program of the Alaska Migratory Bird Co-Management Council. This program relies on collaboration among the U.S. Fish and Wildlife Service, the Alaska Department of Fish and Game, and a number of regional Alaska Native organizations. Information obtained by this program is used to evaluate federal subsistence harvest regulations, to document customary and traditional uses of migratory birds in Alaska, and to plan for the continued harvest and conservation of birds. Participation in the harvest survey is voluntary at both the village and household levels. The survey covers spring, summer, and fall harvests in most regions. Some regions also have a winter survey. Harvest estimates are based on a stratified clustered sampling. The sample frame encompasses all households in villages eligible for the subsistence harvest of migratory birds and their eggs in Alaska. Households are the primary sampling unit and villages are the secondary unit. Data at the household level are confidential and are further aggregated to conform to information management protocols. Data at village level are considered sensitive. Clusters of villages (subregions) with similar harvest patterns allow expansion of reported harvests in surveyed villages to nonsurveyed villages in the same subregion. Subregions are grouped within regions, which approximately correspond to the designated migratory bird management regions. Within villages, households are stratified by harvest level. Villages and regions are surveyed on a rotating schedule based on monitoring priorities and budget constraints.

INTRODUCTION

AMBCC SUBSISTENCE HARVEST ASSESSMENT PROGRAM

In 1918, Canada and the United States ratified the Migratory Bird Treaty Act (the treaty) to protect wild bird populations. The treaty later included agreements with Mexico, Japan, and Russia. The treaty set provisions to protect migratory bird populations, including an annual hunting season closure from March 10 to September 1. However, this provision failed to provide for the harvest of migratory birds by northern peoples of Alaska and Canada in spring and summer; these harvests have been historically necessary to their subsistence way of life. Despite the closure, customary and traditional hunting of migratory birds in spring and summer continued.

In 1997, the U.S. Congress authorized an amendment to the treaty that legally recognized the traditional spring and summer subsistence harvests of migratory birds by northern peoples of Alaska and Canada. The goal of the amendment was to promote conservation of migratory birds by including subsistence hunting in the regulatory process. This amendment authorized the U.S. Fish and Wildlife Service (USFWS) to open regulated spring and summer subsistence hunts of migratory birds in Alaska. The treaty amendment also mandated that Alaska's indigenous inhabitants play a meaningful role in migratory bird conservation by participating in relevant management bodies. As a result of this direction, the Alaska Migratory Bird Co-Management Council (AMBCC) was formed. The AMBCC is composed of representatives from the USFWS, Alaska Department of Fish and Game (ADF&G), and regional Alaska Native entities (CFR vol. 65, No. 60, pp. 16405–16409, March 28, 2000). The AMBCC first met in October 2000, at which time they discussed the assessment of spring–summer subsistence harvests, important for describing traditional historical uses of migratory birds as well as their levels of harvest. Harvest monitoring is also particularly important to meet the intentions of the amended treaty: 1) subsistence harvests generally should remain at traditional levels, relative to bird population sizes; 2) subsistence data should be integrated with flyway and national harvest management programs; and 3) regulatory processes for all migratory bird hunting should be inclusive to users and responsive to conservation needs. The AMBCC found the available harvest data insufficient to properly address management issues, and formed the Subsistence Harvest Survey Committee. This group of Alaska agency staff, regional partners, and consultants was charged with designing a statewide migratory bird subsistence harvest survey to assess the magnitude and composition of subsistence harvests.

A comprehensive statewide harvest survey protocol (AMBCC 2003) was designed based on the harvest surveys conducted in the context of a goose management plan (Pamplin 1986; Zavaleta 1999) for the Bristol Bay (Seim and Wentworth 1996; Wentworth 2007a), Yukon–Kuskokwim delta (Wentworth and Seim 1996; Wentworth 1998, 2004, 2007b), and Bering Strait areas (Kawerak Inc. 2004), as well as on elements of the USFWS Harvest Information Program (HIP), which assesses sport harvests of selected migratory bird species. The AMBCC subsistence harvest assessment program was to begin with the first open spring–summer subsistence season in 2003, but delays in survey approval and other procedural problems prevented harvest data collection and the survey was first implemented in 2004. However, the subsistence harvest survey has not been implemented to full performance standards, due primarily to inadequate funding of the survey program; the budget has been 40–50% short every year, and it has not been adjusted for inflation. Consequently, cost-cutting measures have resulted in reduced sampling efforts

and limited resources for village outreach as well as surveyor and field-coordinator training. In 2005, the Harvest Survey Committee economized by adopting a regional rotation, and since then only the Yukon–Kuskokwim delta region has been surveyed yearly. Other regions are surveyed approximately every other year, depending on monitoring priorities and budget constraints. The necessity of reduced and rotating survey coverage has significantly impaired the accuracy of harvest estimates and greatly extended the time necessary to detect changes in harvest levels.

In 2007, the AMBCC Harvest Survey Committee asked the ADF&G Division of Subsistence to assess the performance of the original survey design, the effectiveness of the diminished sampling effort, and other operational issues. Based on the survey assessment report (Naves et al. 2008), the AMBCC Subsistence Harvest Survey Committee evaluated problems, considered technical improvements to the survey methods, and collaboratively reformulated an operational plan which will be implemented in 2010. The AMBCC and its Harvest Survey Committee recognize the need to conduct an effective survey that provides timely and accurate harvest information in order to meet treaty obligations, as well as to sustain migratory bird populations and harvest traditions.

AMBCC MEMBER ORGANIZATIONS

The Alaska Migratory Bird Co-Management Council is composed of representatives from:

- U.S. Fish and Wildlife Service;
- Alaska Department of Fish and Game;
- Chugach Regional Resources Commission;
- Sun’aq Tribe of Kodiak;
- Aleutian–Pribilof Islands Association;
- Bristol Bay Native Association;
- Association of Village Council Presidents;
- Kawerak Inc.;
- Maniilaq Association;
- North Slope Borough;
- Tanana Chiefs Conference;
- Copper River Native Association; and
- Southeast Inter-Tribal Fish and Wildlife Commission.

USES OF THE INFORMATION FROM THE SUBSISTENCE HARVEST SURVEY

Harvest estimates from the subsistence harvest survey will be available to the communities (“villages”), Alaska Native organizations, state and federal resource management and conservation agencies, the Pacific Flyway Council, and the general public. Data at the household level are confidential and data at the village level are considered sensitive. Preliminary harvest estimates based on survey data are submitted to Alaska Native regional partners for review before being adopted by the AMBCC. Information from the survey is not to be used for punitive enforcement purposes, nor has this been reported to have happened. Survey data are used to:

- Document the importance of customary and traditional uses of migratory birds by Alaska rural villages so that subsistence uses will be protected and conducted in a sustainable manner;
- Document subsistence harvest trends and track major changes in harvests;
- Assist the USFWS in the evaluation of spring–summer migratory bird harvest regulations; and
- Assist in the development of management plans by state and federal agencies.

METHODS

DATA COLLECTION

Regions, Subregions, Villages

A total of 192 rural villages have been listed within the regions eligible to participate in the subsistence harvest of migratory birds in Alaska (50 CFR, Part 92, Subpart 92.5, Appendix A). According to the Alaska Department of Labor and Workforce Development's year 2007 population estimates, these villages have a total population of approximately 87,000 people in 25,000 households (ADLWD 2009). A census survey to evaluate the subsistence harvests of migratory birds within eligible areas would be impractical and cost prohibitive. Thus, appropriate sampling of regions, subregions, villages, and households is the basis for the calculation of harvest estimates. Data collection from the 2004–2007 survey sometimes deviated from the original survey design (AMBCC 2003; Wentworth 2006) by varying degrees, largely as a result of budget constraints and operational difficulties (Naves et al. 2008).

The sample frame encompasses all households in villages eligible for the subsistence harvest of migratory birds and their eggs in Alaska. The household is the primary sampling unit and the village is the secondary unit. Grouping villages with similar harvest patterns into subregions allows for the expansion of reported harvests from surveyed villages to nonsurveyed villages in the same subregion. The subregions are grouped into regions, which approximately correspond to the 12 designated migratory bird management regions (figures 1–11) (CFR vol. 68, No. 139, pp. 43010–43030, July 21, 2003). The survey, however, covers only 10 of these regions—the Gulf of Alaska and Cook Inlet regions were combined because of their small numbers of eligible villages, and the Southeast Alaska region was not surveyed. The original survey protocol listed 32 subregions within the 10 regions (Wentworth 2006). Subregions in the Bristol Bay and Interior Alaska regions were revised by the AMBCC Harvest Survey Committee in 2009, which resulted in a total of 29 subregions (Appendix A). Data analysis for this report was based on this revised configuration of subregions so that future results will be comparable.

Rotation of regions based on monitoring priorities has been implemented as a cost reduction measure (Table 1). Two-thirds of the villages in each surveyed region are to be sampled every year (Reynolds 2007). Regional hub villages (Bethel, Dillingham, Kotzebue, Barrow, Nome, Kodiak, Unalaska, and Tok) are to be surveyed each year that their region is surveyed because these larger villages may have different harvest patterns (e.g., fewer harvesters and lower harvests per hunter) than the smaller villages. However, coverage of regions has occasionally been incomplete because of difficulties related to funding and to field operations.

The following organizations participated in data collection from 2004 through 2007:

- Gulf of Alaska–Cook Inlet region: ADF&G Division of Subsistence, Port Graham Village Council;
- Kodiak Archipelago region: Kodiak Area Native Association, Kodiak National Wildlife Refuge, ADF&G Division of Subsistence;
- Aleutian–Pribilof Islands region: Aleut Marine Mammal Commission, ADF&G Division of Subsistence;
- Bristol Bay region: Bristol Bay Native Association;

- Yukon–Kuskokwim delta region: Yukon Delta National Wildlife Refuge, Togiak National Wildlife Refuge, ADF&G Division of Subsistence;
- Bering Strait–Norton Sound: Kawerak Inc.;
- Northwest Arctic: Maniilaq Association, Selawik National Wildlife Refuge;
- North Slope region: North Slope Borough;
- Interior Alaska: Innoko National Wildlife Refuge, Kanuti National Wildlife Refuge, Koyukuk National Wildlife Refuge, Yukon Flats National Wildlife Refuge, ADF&G Division of Subsistence; and
- Upper Copper River region: Cheesh-na Tribal Council. Assist in the development of management plans by state and federal agencies. Regions surveyed from 2004–2007.

Sampling Methods

The original survey design called for a 3-level stratified sampling (“none, low, high”) of survey households within a village and the evaluation of this sampling method once sufficient statewide data were accumulated (AMBCC 2003; Wentworth 2006). Eligible villages across the state vary from a few households in size to about 2,000 households. Variations in village size led to the application of other sampling methods (Naves et al. 2008).

The current precision goal of the subsistence harvest survey is to provide results comparable to the HIP sport hunting monitoring program—95% confidence intervals within 10% of the estimated harvest. However, there are difficulties in comparing confidence intervals from these 2 surveys: 1) HIP currently does not report confidence intervals for harvest estimates of individual species, 2) some species harvested for subsistence uses are not included in the HIP survey, and 3) different sport and subsistence hunting patterns may have different effects on the precision of harvest estimates.

The subsistence harvest survey covers a large geographic area and a large number of species. Some species are abundant and harvested in large numbers. Other species are harvested only occasionally because they have small populations, restricted distribution, or are not used for subsistence purposes. “Wide coverage” harvest assessment programs cannot address both commonly- and rarely-harvested species with the same level of precision. After the publication of the first spring–summer subsistence harvest regulations in 2003, the public, along with resource managers, expressed strong interest in subsistence takes of nongame bird species, which are sometimes harvested, and in relatively low numbers. Dedicated harvest surveys and studies are required to determine the harvests of species that have small populations, low densities, or limited distributions, and that are less likely to be precisely documented in the statewide subsistence harvest survey.

“None, Low, High” Stratification

The survey relies on a village household list that includes all “resident” households. A household is considered resident if its members live in the village year-round and have lived in the village for at least the 12 previous months. The list of resident households does not include unoccupied dwellings, commercial buildings, and public buildings. Prior to the survey, the surveyor classifies the resident households, according to their general harvest patterns, into only 1 of 3 harvest level strata: “none” (0 birds), “low” (1–10 birds), and “high” (10+ birds). The surveyor then draws a random sample from each harvest level so that 10% of all households in the “none,” 15% of households in the “low,” and 40% in the “high” stratum are sampled.

Census: 100% sampling

Sampling by census (100% sampling) is usually attempted in small villages (up to about 40 households) because of difficulties in implementing 3-level stratification with a small total number of households.

Simple Random Sampling

Random selection of households without harvest level stratification is also used occasionally. Also, if a census has been attempted but some households could not be contacted, sampling is treated as a simple random sampling.

“Harvester, Other” Stratification

In some cases, expansion of reported harvests is based on a 2-level stratification of “harvester, other.” “Harvester” includes all harvester households (“low” and “high” strata in 3-level stratification) and “other” includes nonharvester households (“none” stratum) as well as nonlisted households (“unknown” households). Three-level stratification of “none, low, high” is difficult to implement in large villages because 1) surveyors frequently do not know the general harvest patterns of all households, 2) large rural villages frequently have large turnovers in their populations, and 3) household lists for large villages often do not represent all resident households. It is difficult and costly to keep updated household lists of large villages. In the case of an incomplete household list, it would be inappropriate to assume that sampling of large villages approached a simple random sampling. Most likely, the households included in the household list were harvesters as opposed to nonharvesters, because field coordinator and surveyor training emphasized the importance of surveying a higher proportion of high harvesters (Wentworth 2006). Also, locally hired surveyors were more likely to be familiar with Alaska Native households. Therefore, as of 2008, the “harvester, other” stratification has been adopted for sampling large villages.

The Survey Year and Survey Seasons

As stated earlier, the primary goal of the survey is to document spring–summer subsistence harvests under subsistence regulations. Although open seasons vary on an annual basis according to subsistence harvest regulations, for purposes of this survey, the “survey year” is April 1 through October 31 in most regions, except in Southern Coastal Alaska (the Aleutian–Pribilof Islands, Kodiak Archipelago, Gulf of Alaska–Cook Inlet, and the South Alaska Peninsula of Bristol Bay), where the survey year ends on March 9. The “survey season” refers to the timing and frequency of collection of harvest data. There are 3 survey seasons (or recall periods): spring, summer, and fall or fall–winter (Table 2). The fall (after September 1) migratory bird hunts are managed under early season frameworks in federal regulations selected and adopted as state regulations. Harvests from fall hunts should be captured by the HIP survey; however, the HIP survey is most likely ineffective in documenting fall subsistence harvests in rural Alaska because of low hunter participation in the HIP program. For this reason, the AMBCC subsistence harvest survey also covers fall or fall–winter.

Table 2.–Seasonal survey coverage and household visits.

The harvest report form is composed of 3 pages, 1 page for each season. As in the original survey protocol, surveyors make 4 visits to each participating household during a survey year (Wentworth 2006). In April, surveyors distribute survey forms to participating households. After the end of each survey season, surveyors visit each participating household to collect the appropriate page of the survey form (Table 2).

The intent of designing 3 survey recall periods is to help respondents more accurately recall the number and species of birds and eggs they harvest, given the large number of species included on the survey. Increasing the length of the recall period may increase recall bias (Westat Inc. 1989). However, difficulties with survey funding and field operations have prevented seasonal collection of harvest data as originally scheduled. A large proportion of surveys have been done with a single household visit at the end of the survey year (Naves et al. 2008).

Village and Household Consent

The survey is conducted only in villages and households that have agreed to participate. Village consent must be granted in writing, and is often given as a tribal or village council resolution. Individual household consent is documented with permission slips, which also allow calculation of household participation rates. During the first visit to each selected household, the surveyor explains the purpose of the survey to an adult household member, explains how the survey works, and invites the household to participate.

No Contact and Refusals

If after 3 reasonable attempts the surveyor cannot contact a selected household, or if a selected household declines to participate, then an alternate household is selected to replace it. If stratification is used, the alternate household must be at the same harvest level as the no contact–no consent household.

Reporting Harvests

The harvest report form is used to record the subsistence harvest of migratory birds and their eggs (Appendix B). Due to the variation in the availability and distribution of bird species, there are 3 versions of the harvest report form, each with a different set of species. The versions are for Interior Alaska, Southern Coastal Alaska, and the remaining villages (Appendix C). This helps to prevent mistakenly recording bird species as harvested in areas where they do not normally occur.

The harvest report form has 1 sheet for each survey season (spring, summer, and fall or fall–winter). For regions with a winter survey, fall and winter harvest data are collected with a fall–winter form, and cannot be identified by each season individually. Each sheet has color illustrations of bird species in breeding plumage and fields to record the total number of birds harvested and the total number of eggs harvested.

If a household harvests birds or eggs and gives them to another household, the harvest is to be recorded by the household that originally harvested the birds–eggs, and not by the household that received them. If a household does not harvest birds–eggs, any birds or eggs they receive are not to be recorded on their survey form.

Species Represented on the Harvest Report Form

The diverse subsistence cultures and economies across Alaska use a wide variety of migratory bird species, subject to seasonal availability, hunter access, and local traditions. The 2003 federal subsistence regulations allowed spring–summer harvest of about 90 species and subspecies of migratory birds, subject to seasons and restrictions (CFR vol. 68, No. 139, pp. 43010–43030, July

21, 2003). The harvest report form depicts about 50 species. The survey form was designed to record harvests of only those species that are significant to subsistence uses. Harvest of species not represented in the survey form can be reported in the “other bird” field. Identifying birds by subspecies can be difficult and it may be difficult to tell some species from others. The survey form does not differentiate between species and subspecies that are difficult to tell apart. To represent all species open to harvest on the survey forms would also result in an unwieldy, long survey.

Some bird species and eggs that are closed to harvest are depicted on the survey form. The inclusion of species closed to harvest on the survey form is not an endorsement of, nor consent to engage in, the harvest of closed species. Rather, it is an attempt to collect accurate harvest data to aid in the sustainable management of all bird species. Management and conservation bodies, such as the AMBCC, the USFWS, and the flyway councils, need to know the numbers of birds and eggs taken to successfully plan for the sustainable management of bird populations. In order to elicit accurate answers to potentially sensitive questions, it is imperative that information from the survey is not used for punitive enforcement. To aid in this effort, identification of households is strictly confidential. The list of birds and eggs closed to subsistence harvest varies between areas according to the yearly hunting regulations.

Data Transfer

The surveyor is required to check returned survey forms for completeness and correctness before sending them to the field coordinator. Upon receiving each batch of completed forms from surveyors, the field coordinator then organizes and reviews all survey materials before sending them to the survey coordinator. This step allows field coordinators to correct potential inconsistencies in data collection and to manage surveyor payment.

Data Management and Reporting

Data management and archiving is completed by the Information Management Unit of the ADF&G Division of Subsistence. The survey coordinator works closely with the unit to produce and report harvest estimates.

Data are entered in Microsoft Office Access 2003¹ forms that are designed to mimic survey forms. The multiyear raw data are stored in a Microsoft SQL Server 2005 relational database and backups occur on a monthly basis. The structure of the database is documented in appropriate metadata. Double data entry and logical checks help ensure the accuracy of the information stored in the database and of the sampling information provided with completed survey forms (e.g., sampling method used, sample sizes, strata size). Logical checks and data analysis are done with SPSS Statistics 2008.

Original survey forms are scanned and archived as digital files. Archived survey materials do not include household names or other personal information in order to ensure confidentiality of household harvest reports. If household names are inadvertently revealed in the survey forms, the information is obscured prior to archiving.

DATA ANALYSIS

Geographic Scale of Harvest Estimates

Harvest estimates are calculated at the subregional and regional levels. Harvest estimates at the

¹ Product names are given for scientific completeness or because they are established standards for the State of Alaska; they do not constitute product endorsement.

regional level are produced when at least 75% of the households within the region are represented in the sample (see below). Because of issues related to management of species of conservation concern, the North Slope and the Bering Strait–Norton Sound regions have requested harvest estimates to be presented at the regional level only. Appropriate subregional sampling coverage in these 2 regions has supported this method of calculation of regional harvest estimates.

Harvest estimates at the subregional level may vary considerably between years (Table 4 and Table 5). Several factors may be involved:

- Yearly variation in the local abundance of birds;
- Hunter access to productive hunting grounds;
- Yearly variation in hunting effort associated with availability of other subsistence resources, especially salmon *Oncorhynchus* and caribou *Rangifer tarandus*, or with temporary employment in the cash economy;
- Inappropriate subregional sampling coverage; and
- Heterogeneity of harvest patterns in villages within a subregion.

To calculate statewide harvest estimates, this large yearly variation in subregional harvest estimates will require analytical approaches that account for variability in harvest between years as well within subregions. Development of accurate statewide estimates may require more years of data as well as appropriate coverage of infrequently surveyed regions, such as the Northwest Arctic and the Kodiak Archipelago. For a better understanding of yearly variation in subregional estimates, it is important to continue reporting harvest estimates at the subregional level.

Expansion at the Subregional Level

The subsistence harvest survey employs a stratified, clustered sampling approach (Cochran 1977). Harvest estimates are calculated for each season and the annual estimate is calculated as the sum of seasonal harvests, although there are a few difficulties. For example, one or more seasonal pages of the harvest report form may be missing for individual households. As a consequence, the total number of households or sets of households surveyed in a village can vary by season within the same survey year. Furthermore, seasonal data may be missing for an entire harvest level stratum or for an entire village. For these reasons, absolute sample sizes are specific to each harvest level stratum, each season, and each village. Because calculation of annual harvest estimates and confidence intervals requires an annual sample size, the maximum number of households sampled among seasons is used.

The reported harvest is first expanded in each harvest level stratum and village: harvests reported by households sampled in each stratum are expanded to all households in that stratum. The number of harvest level strata may be 3 (“none, low, high”), or 2 (“harvester, other”), or 1 (census or simple random sampling). Thus during the calculation of this first expansion, expansion factors are specific to each harvest level and season in each village surveyed. The following formula is used for the first expansion:

Estimated harvest at harvest level stratum = sum of harvests reported by all households in a stratum * (number of households sampled in the stratum / total number of households in the stratum).

The mean harvest within the subregion is used as a substitute for missing data at the harvest level and the season. The harvest estimates per year, per village, per season, and per species are calculated as the sum of the estimated harvest at each harvest level stratum.

The second expansion calculation expands estimated harvests in surveyed villages to all villages within the subregion. Because the number of households varies widely between villages within a subregion, this second expansion is calculated using the number of households in surveyed and nonsurveyed villages in a subregion. The following formula is used:

Estimated harvest at subregional level = sum of the estimated harvest in surveyed villages * (number of households in surveyed villages / total number of households in the subregion).

Formulas used to estimate harvests and confidence intervals at the subregional level were based on Cochran (1977) and Bernard et al. (1998) (Appendix D). The formula used to calculate estimated harvests accounts for missing data at each harvest level stratum. However, if seasonal data are missing for all harvest level strata in a village, customized analytical approaches are necessary in order to use mean replacement.

The total number of households in the subregion is calculated as the sum of total households in the surveyed villages plus the estimated village size of the nonsurveyed villages. For surveyed villages, the total number of households represents the number of households resident in the village for at least 12 months and excludes unoccupied dwellings and households that recently moved to the village. The total number of resident households in surveyed villages is provided by the field coordinator as part of the sampling information in the “household list.” Village size estimates are obtained by dividing State of Alaska yearly village population estimates from the Alaska Department of Labor and Workforce Development² by the average household size as reported in the 2000 federal census (U. S. Census Bureau 2001) (village population divided by the number of households).

The total number of households provided by field coordinators and village estimated sizes are compared in order to assess whether household lists are complete. Annual village size as recorded in the Division of Subsistence Community Subsistence Information System³ (CSIS) is also used to assess the completeness of household lists. If these sources yield a discrepancy greater than 30–40% in the number of households, efforts are made to contact the field coordinator and obtain local information on village size, such as from lists held by tribal councils. If local information on village size cannot be obtained, CSIS information or estimated village sizes are used in harvest expansions.

Villages for which sampling information is missing (the household list, sampling method, or harvest level strata size are not provided) are not included in the analysis.⁴

Expansion at Regional Level

The third expansion expands the estimated harvest in surveyed subregions to all subregions within a region. Because the number of households in each subregion varies significantly, this third expansion is based on the number of households in both the surveyed and nonsurveyed subregions in a region, and is calculated as follows:

2 <http://almis.labor.state.ak.us/?PAGEID=67&SUBID=171>, accessed June 7, 2009.

3 <http://www.subsistence.adfg.state.ak.us/CSIS>. Hereinafter cited as CSIS.

4 In 2004, this was 12 out of 89 villages surveyed; 6 out of 81 villages surveyed in 2005; 6 out of 68 villages surveyed in 2006; and 7 out of 81 villages surveyed in 2007.

Estimated harvest at regional level = sum of the estimated harvest in surveyed subregions * (number of households in surveyed subregions / total number of households in the region).

Subregional estimates are expanded to the regional level only if at least 75% of the households within the region are represented in the sample (nonsurveyed subregions must not represent more than 25% of the total households in the region). Formulas used to estimate harvest and confidence intervals at the regional level are based on Cochran (1977) and Bernard et al. (1998) (Appendix E). The formula to estimate harvests does account for missing data at the harvest level stratum. However, if seasonal data are missing for a harvest level stratum in a village, customized analytical approaches are necessary in order to use mean replacement.

Conversion of Egg Volume to Numbers of Eggs

Egg harvest is sometimes reported on this survey by volume, such as the number of “5-gallon buckets” or the number of “1-gallon buckets.” Conversion factors for volumes of eggs to numbers of eggs were estimated by comparing the volumes of eggs of wild bird species reported in the *Birds of North America Series* to the volumes of “large” domestic chicken eggs (personal communication, James Magdanz, ADF&G Subsistence Resource Specialist, Kotzebue, Alaska, June 2009). It is known that 48 large chicken eggs (24 oz per dozen, U.S. Department of Agriculture standard) can be arranged in a 1-gallon bucket. This comparison is necessary because eggs of different size and shape arrange differently; i.e., the amount of empty space between eggs is related to the size and shape of the eggs. In the future, actual counts of eggs per gallon should be documented on the egg gathering grounds.

Table 3.–Estimated conversion factors, egg volume to number of eggs.

Species	Number of eggs in 5-gallon bucket	Number of eggs in 1-gallon bucket
Mallard ^a	261	52
Pintail ^b	327	65
Arctic tern ^c	716	143
Mew gull ^d	261	52
Glaucous gull ^e	121	24
Glaucous-winged gull ^f	147	29
Herring gull ^g	147	29
Murre ^h	126	25

Reports of Fall Egg Harvest

Harvest reports occasionally include eggs gathered in fall (September 1 through October 31) or fall–winter (September 1 through March 9). However, the nesting period of birds in Alaska is usually only as late as July and there are no records of customary and traditional uses of eggs that have failed to hatch. For these reasons, reports of eggs harvested in fall or fall–winter are considered to be recording inconsistencies in which the surveyor or the household member records the harvest on the wrong seasonal page or in the field reserved for “birds” rather than in the field reserved for “eggs.” Each of these cases are individually assessed and assumed to be harvest of birds in fall or harvest of eggs in spring, based on the harvest patterns of the household and of the village.

Household Participation Rates

Household participation in the survey is voluntary. The original survey method used permission slips to document household participation in the survey. During the first visit, when the surveyor invites each selected household to participate, he or she completes a permission slip for every visited household regardless of whether the household agrees to participate (“yes”) or not (“no”). The following potential issues in the use of these permission slips have been identified:

- Permission slips have not been completed for every household visited;
- Permission slips have been completed incorrectly (“no” could represent “no harvest” or “no contact” rather than “no consent to conduct the survey”); and
- The Information Management unit did not receive all completed permission slips.

Household participation rates at the regional and subregional levels are calculated based on the permission slips available for analysis (see the Results section). Identified instances where “no” could represent “no contact” or “no harvest” rather than “no consent” are not included in the analysis of household participation rate. Household participation rates are calculated as the number of households that agreed to participate in the survey (“yes”) divided by the total number of permission slips available.’

RESULTS

Harvest estimate tables presented in this report include only the bird species represented in the appropriate version of the harvest report form used at each region or subregion (Appendix C). The species categories of “Duck (unidentified)” and “Other/unknown bird” are included in tables only if harvest in these categories is reported.

Information on sampling effort is presented in a footnote to each harvest estimate table. For subregional tables, “sampling effort” refers to the number of villages surveyed and the proportion of subregion households represented in the sample (the number of households in surveyed villages in relation to the total number of households in the subregion). For regional tables, sampling effort refers to the number of villages and of subregions surveyed. Major deviations from survey protocols, such as significantly incomplete geographic coverage or nonstandard village sampling approaches, are also documented in table footnotes.

Regional estimates are not presented if nonsurveyed subregions represented more than 25% of the regional households. If not all subregions were surveyed, regional harvest estimates may be larger than the sum of the surveyed subregions because expanded estimates account for nonsurveyed subregions.

Annual estimates for the total harvests of birds and eggs at the regional and subregional levels are summarized in Table 4 and Table 5. Regional and subregional estimates in these tables indicate that estimates detailed by species are available in the regional and subregional tables that follow. Regional and subregional tables are presented in chronological order: 2004 (tables 6–45), 2005 (tables 46–77), 2006 (tables 78–117), and 2007 (tables 118–153). Within each data year, a regional table precedes the tables for its subregions unless survey coverage was not enough to allow calculation of regional estimates (e.g. Aleutian–Pribilof Islands, 2005 and 2007). Household participation rates for 2004–2007 are presented in Table 154.

Sampling effort (Upper Copper River, 2004): 6 out of 8 villages in this region were surveyed; sampling and expansion of reported harvest represent Alaska Native households only. Upper Copper River AMBCC Alaska Native regional partner noted that "small shorebirds" are not usually harvested for subsistence uses; data entry and analysis were reviewed, no mistakes were found.

-: No reported harvest. *: 95% CI ≥ 100%.

Sampling effort (North Slope, 2007). ^aThere is no fall survey in the North Slope Region. 5 out of 8 villages in this region were surveyed; 2 out of 2 subregions were represented in the sample. Harvest estimates presented only at regional level as per request of regional partners. Barrow subregion estimates assumed Simple Random Sampling. -: No reported harvest. *: 95% CI ≥ 100%.

^bIn the North Slope Region, loons occasionally entangle in subsistence fishing nets. Entangled Yellow-billed loons salvaged from fishing nets are used for ceremonial purposes and were reported as "harvested" in this survey. Non-standard survey methods likely resulted in overestimation of harvest. Reported numbers of Yellow-billed loons for the region were 16 birds in 2007.

Household Participation Rate = Number of households that agreed to participate / Total number of households for which permission slips are available.

*: Number of households for which permission slips are available (may not represent the total number of households surveyed).

-: Information not available (region/subregion not surveyed or permission slips not available for data management and analysis).

ACKNOWLEDGEMENTS

This harvest assessment program would not be possible without the strong local support of the villages where the surveys are conducted. The AMBCC and the ADF&G Division of Subsistence are most grateful to the hundreds of households that volunteer to report their subsistence harvests of migratory birds to locally hired surveyors and to the village and tribal councils that facilitate village participation in the survey. The AMBCC and the ADF&G Division of Subsistence are very thankful for the collaboration of the many Alaska Native organizations and national wildlife refuges that coordinate data collection regionally. We thank Terri Lemons, ADF&G Division of Subsistence, for preparing the maps presented in this report. We thank Dave Koster and the ADF&G Division of Subsistence Information Management Unit for providing continuous support with data entry, management, and analysis. We also thank Lisa Olson and Garrett Zimpelman, ADF&G Division of Subsistence, for their great assistance as editors of this report.

- Sources* For information on distribution range of species: Johnson and Herter (1989), National Geographic Society (1999), The Birds of North America Series, Sea Duck Joint Venture (2003-2005), Denlinger (2006), Johnson et al. (2007), Alaska Shorebird Group (2008), Bowman (2008), Richard Lanctot (USFWS, Pers. Communication), Eric Taylor (USFWS, Pers. Communication), Donna Dewhurst (USFWS, Pers. Communication), Davis Irons (USFWS, Pers. Communication), Chris Dau (USFWS, Pers. Communication), Daniel Rosenberg (ADF&G, Pers. Communication).
- a. South Alaska Peninsula is a subregion of the Bristol Bay region; most of the Bristol Bay region is surveyed with the Main Form, but the South Alaska Peninsula is surveyed with the Southern Coastal Alaska form.
 - x The species/species group is represented in the harvest report form used in the region. Numbers in parenthesis indicate the species or the composition of species likely to occur in each region.
 - The species/species group is not represented in the harvest report form used in the region.
 - x (-) The species is represented in the harvest report form but it is unlike to occur in the region.
 - (x) The species is not represented in the harvest report form but likely occurs in the region.
 - * Species closed to harvest of birds or eggs, at least in certain management units.

Appendix D.–Formulas to calculate subregion estimated harvests, variances, and confidence intervals (3-stage stratified cluster sampling).

$$X_s = \frac{N_{1s}}{n_{1s}} \left[\sum_{i=1}^h \frac{N_{2si}}{n_{2si}} \left[\sum_{j=1}^{h_i} \frac{N_{3sij}}{n_{3sij}} \left[\sum_{k=1}^{n_{3sij}} x_{sijk} \right] \right] \right]$$

This formula, used to calculate estimated harvest at the subregional level, does account for missing strata, but it does not account for missing seasons. If a whole season is missing for any village, complementary analytical procedures are necessary to implement mean replacement.

$$Var(X_s) = N_{1s}^2 \left(1 - \frac{n_{1s}}{N_{1s}}\right) \frac{s_{1s}^2}{n_{1s}} + \frac{N_{1s}}{n_{1s}} \left[\sum_{i=1}^h N_{2si}^2 \left(1 - \frac{n_{2si}}{N_{2si}}\right) \frac{s_{2si}^2}{n_{2si}} \right] + \frac{N_{1s}}{n_s} \left[\sum_{i=1}^h \frac{N_{2si}}{n_{2si}} \left[\sum_{j=1}^{h_i} N_{3sij}^2 \left(1 - \frac{n_{3sij}}{N_{3sij}}\right) \frac{s_{3sij}^2}{n_{3sij}} \right] \right]$$

$$CI(X_s) = t_{1/\alpha} \times \sqrt{\text{var}(X_s)}$$

$$CIP(X_s) = t_{1/\alpha} \times \sqrt{\text{var}(X_s)} \frac{1}{X_s}$$

Where:

$$s_{1s}^2 = \frac{\sum_{i=1}^h \left[\sum_{j=1}^{h_i} \left[\sum_{k=1}^{n_{3sij}} (x_{sijk} - \bar{x}_s)^2 \right] + (\bar{x}_{sij} - \bar{x}_s)^2 p_{3sij} \right]}{n_{1s}}$$

$$p_{3sij} = N_{3sij} - n_{3sij}$$

$$s_{2si}^2 = \frac{\sum_{j=1}^{h_i} \left[\sum_{k=1}^{n_{3sij}} (x_{sijk} - \bar{x}_{si})^2 \right] + (\bar{x}_{sij} - \bar{x}_{si})^2 p_{3sij}}{n_{2si}}$$

$$s_{3sij}^2 = \frac{\sum_{k=1}^{n_{3sij}} (x_{sijk} - \bar{x}_{sij})^2}{n_{3sij}}$$

$$\bar{x}_s = \frac{N_{1s}}{n_{1s}} \left[\sum_{i=1}^h \frac{N_{2si}}{n_{2si}} \left[\sum_{j=1}^{h_i} \frac{N_{3sij}}{n_{3sij}} \left[\sum_{k=1}^{n_{3sij}} x_{sijk} \right] \right] \right]$$

$$\bar{x}_{si} = \frac{N_{2si}}{n_{2si}} \left[\sum_{j=1}^{h_i} \frac{N_{3sij}}{n_{3sij}} \left[\sum_{k=1}^{n_{3sij}} x_{sijk} \right] \right]$$

$$\bar{x}_{sij} = \frac{N_{3sij}}{n_{3sij}} \left[\sum_{k=1}^{n_{3sij}} x_{sijk} \right]$$

- X_s = Subregion estimated harvest.
- $Var(X_s)$ = Variance of subregional harvest estimate.
- CI = Confidence interval.
- CIP = Confidence interval percentile.
- s = Subscript that denotes first-stage units (subregion).

- i = Subscript that denotes second-stage units (sampled strata, or harvest level).
- j = Subscript that denotes third-stage unit (sampled strata).
- k = Subscript that denotes households.
- h = Total number of villages sampled in a subregion.
- h_i = Total number of strata sampled in the village.
- N_{1s} = Total number of households in subregion s .
- n_{1s} = Total number of households in sampled villages in subregion s .
- N_{2s} = Total number of households in all strata of a village in subregion s .
- n_{2s} = Total number of households in sampled strata of a village in subregion s .
- N_{3s} = Total number of households in each stratum of a village in subregion s .
- n_{3s} = Number of households sampled in each stratum of a village in subregion s .
- x_{sijk} = Individual household reported harvest.
- s_1^2 = First-stage sample variance.
- s_2^2 = Second-stage sample variance.
- s_3^2 = Third-stage sample variance.
- \bar{x} = Weighted household harvest mean.
- \bar{x}_r = mean household harvest at subregional level.
- \bar{x}_{si} = mean household harvest at village level.
- \bar{x}_{sij} = mean household harvest at harvest level.
- P_{3sij} = Factor to account for variance of non-sampled households for which a mean harvest was applied.
- $t_{1/\alpha}$ = Student's t distribution value with tail area probability α .

Note The term " N_{2si}/n_{2s} " accounts for missing stratum at the village level; this term equals 1 if all strata in the village have been surveyed. For instance:

	None	Low	High	
Total households	20	40	20	$N_{2si} = 80$
Sampled households	0	20	20	$n_{2si} = 60$

Appendix E.–Formulas to calculate region estimated harvests, variances, and confidence intervals (4-stage stratified sampling).

$$X_r = \frac{N_{1r}}{n_{1r}} \left[\sum_{s=1}^h \frac{N_{2rs}}{n_{2rs}} \left[\sum_{i=1}^{h_s} \frac{N_{3rsi}}{n_{3rsi}} \left[\sum_{j=1}^{h_{si}} \frac{N_{4rsij}}{n_{4rsij}} \left[\sum_{k=1}^{n_{4rsij}} x_{rsijk} \right] \right] \right] \right] \right]$$

Note: This formula, used to calculate estimated harvest at the regional level, does account for missing strata, but it does not account for missing seasons. If a whole season is missing for any village, complementary analytical procedures are necessary to implement mean replacement.

$$\begin{aligned} \text{Var}(x) = & N_{1r}^2 \left(1 - \frac{n_{1r}}{N_{1r}}\right) \frac{S_{1r}^2}{n_{1r}} + \frac{N_{1r}}{n_{1r}} \left[\sum_{s=1}^h N_{2rs}^2 \left(1 - \frac{n_{2rs}}{N_{2rs}}\right) \frac{S_{2rs}^2}{n_{2rs}} \right] + \frac{N_{1r}}{n_{1r}} \left[\sum_{s=1}^h \frac{N_{2rs}}{n_{2rs}} \left[\sum_{i=1}^{h_s} N_{3rsi}^2 \left(1 - \frac{n_{3rsi}}{N_{3rsi}}\right) \frac{S_{3rsi}^2}{n_{3rsi}} \right] \right] \\ & + \frac{N_{1r}}{n_{1r}} \left[\sum_{s=1}^h \frac{N_{2rs}}{n_{2rs}} \left[\sum_{i=1}^{h_s} \frac{N_{3rsi}}{n_{3rsi}} \left[\sum_{j=1}^{h_{si}} N_{4rsij}^2 \left(1 - \frac{n_{4rsij}}{N_{4rsij}}\right) \frac{S_{4rsij}^2}{n_{4rsij}} \right] \right] \right] \end{aligned}$$

$$CI(X_r) = t_{1/\alpha} \times \sqrt{\text{var}(X)}$$

$$CIP(X_r) = t_{1/\alpha} \times \sqrt{\text{var}(X)} \frac{1}{X_r}$$

Where:

$$S_{1r}^2 = \frac{\sum_{s=1}^h \left[\sum_{i=1}^{h_s} \left[\sum_{j=1}^{h_{si}} \left[\sum_{k=1}^{n_{4rsij}} (x_{rsijk} - \bar{x}_r)^2 \right] + (\bar{x}_{rsij} - \bar{x}_r)^2 p_{4rsij} \right] \right] \right]}{n_{1r}} \quad p_{4rsij} = N_{4rsij} - n_{4rsij}$$

$$S_{2rs}^2 = \frac{\sum_{i=1}^{h_s} \left[\sum_{j=1}^{h_{si}} \left[\sum_{k=1}^{n_{4rsij}} (x_{rsijk} - \bar{x}_{rs})^2 \right] + (\bar{x}_{rsij} - \bar{x}_{rs})^2 p_{4rsij} \right]}{n_{2rs}}$$

$$S_{3rsi}^2 = \frac{\sum_{j=1}^{h_{si}} \left[\sum_{k=1}^{n_{4rsij}} (x_{rsijk} - \bar{x}_{rsi})^2 \right] + (\bar{x}_{rsij} - \bar{x}_{rsi})^2 p_{4rsij}}{n_{3rsi}} \quad S_{4rsij}^2 = \frac{\sum_{k=1}^{n_{4rsij}} (x_{rsijk} - \bar{x}_{rsij})^2}{n_{4rsij}}$$

$$\bar{x}_r = \frac{N_{1r}}{n_{1r}} \left[\sum_{s=1}^h \frac{N_{2rs}}{n_{2rs}} \left[\sum_{i=1}^{h_s} \frac{N_{3rsi}}{n_{3rsi}} \left[\sum_{j=1}^{h_{si}} \frac{N_{4rsij}}{n_{4rsij}} \left[\sum_{k=1}^{n_{4rsij}} x_{rsijk} \right] \right] \right] \right] \right]$$

$$\bar{x}_{rs} = \frac{N_{2rs}}{n_{2rs}} \left[\sum_{i=1}^{h_s} \frac{N_{3rsi}}{n_{3rsi}} \left[\sum_{j=1}^{h_{si}} \frac{N_{4rsij}}{n_{4rsij}} \left[\sum_{k=1}^{n_{4rsij}} x_{rsijk} \right] \right] \right] \right]$$

$$\bar{x}_{rsi} = \frac{N_{3rsi}}{n_{3rsi}} \left[\sum_{j=1}^{h_{si}} \frac{N_{4rsij}}{n_{4rsij}} \left[\sum_{k=1}^{n_{4rsij}} x_{rsijk} \right] \right]$$

$$\bar{x}_{rsij} = \frac{N_{4rsij}}{n_{4rsij}} \left[\sum_{k=1}^{n_{4rsij}} x_{rsijk} \right]$$

X_r = Region estimated harvest.
 $\text{Var}(X_r)$ = Variance of region harvest estimate.

- r = Subscript denoting first-stage units (region).
 s = Subscript denoting second-stage units (subregion).
 i = Subscript denoting third-stage units (sampled strata, or harvest level).
 j = Subscript denoting fourth-stage unit (strata).
 k = Subscript denoting individual households.
 h = Total sampled subregions in region r .
 h_s = total sampled villages in subregion s .
 h_{si} = Total sample strata in the village.
 N_{1r} = Total number of households in region r .
 n_{1r} = Total number of households in sampled subregions in region r .
 N_{2rs} = Total number of households in subregion s .
 n_{2rs} = Total number of households in sampled villages in subregion s .
 N_{3rsi} = Total number of households in all strata of a village.
 n_{3rsi} = Total number of households in sampled strata of a village.
 N_{4rsij} = Total number of households in each stratum of a village.
 n_{4rsij} = Number of households sampled in each stratum of a village.
 x_{rsijk} = Individual household reported harvest.
 S_1^2 = First-stage sample variance.
 S_2^2 = Second-stage sample variance.
 S_3^2 = Third-stage sample variance.
 S_4^2 = Fourth-stage sample variance.
 \bar{x} = Weighted household harvest mean.
 \bar{x}_r = mean household harvest at region level.
 \bar{x}_{rs} = mean household harvest at subregion level.
 \bar{x}_{rsi} = mean household harvest at village level.
 \bar{x}_{rsij} = mean household harvest at harvest level.
 P_{4rsij} = Factor to account for variance of non-sampled households for which a mean harvest was applied.
 CI = Confidence interval.
 CIP = Confidence interval percentile.
 $t_{1/\alpha}$ = Student's t distribution value with tail area probability α .
Note The term " N_{3rsi}/n_{3rsi} " accounts for missing stratum at the village level; this term equals 1 if all strata in the village have been surveyed. For instance:

	None	Low	High	
Total households	20	40	20	$N_{3rsi} = 80$
Sampled households	0	20	20	$n_{3rsi} = 60$
